Technical data

Fusion compatibility

Next to the GF specifications for fusion compatibility the national regulations must be considered. The weakest component defines the max. allowable operating pressure.

All pipes must be in accordance with international regulations. The melt flow rate (MFR) must be between 0.2 and 1.4 g/10 min. National rules and regulations must be adhered to. All data given relates to PE 100 pipes.

Couplers (with integrated clamps from d20 – 63 mm) are used in conjunction with PE pipes and PE spigot fittings. Both socket outlets are fused simultaneously (mono-filament) on couplers ≤ d500 mm. Each socket is fused separately (bi-filament) for couplers of d560 mm and above. Couplers with flex groove design are bi-filament from ≥ d500 mm.

Ventilating and Bleed valve Type 591

The 591 valve has a combination of functions. On the one hand the valve allows for a large air discharge whilst filling the pipe and a large air intake whilst draining the pipe. The valve also automatically discharges air while in operation in order to prevent any blockages at points of air culmination.

Automatic function:

The air inside pipelines accumulates at pipe summits. When air bubbles appear in the valve, the float inside the valve will drop which allows the air to be released. When the water rises again, the float is automatically lifted and the valve closes.

Kinetic function:

When emptying a pipeline, the float will drop completely. This allows for a large air volume intake through the large orifice. When filling the pipeline, the water flow inside the pipe will force the air out through the orifice.

Calculation basis for the right valve

Dimensioning

The working pressure range should be defined so that the maximum operating pressure lies within this range, otherwise the valve will not open. The appropriate type and size of ventilating and bleed valve should be selected so that the respective air volume can be conducted off under working pressure.

Density of the medium

To ensure that the cone has optimal lift, the specific weights of the cone materials should be noted in relation to the density of the medium.

Cone material

Cone material	Density
PP-H	0.91 g/cm ³
ABS	1.03 g/cm ³
PP-TV (talc)	1.05 g/cm ³
PVC-U	1.38 g/cm ³
PVC-C	1.50 g/cm ³
PVDF	1.78 g/cm ³

Calculations for valve configuration

To select the correct valve size, the max. flow (Q in m³/h) is first calculated.

To do this, the flow velocity of the medium (vr) is required, as is the inner diameter of the medium-conveying pipe (di).

$$Q = Vr * \frac{\pi}{4} * di^2 * 0.001 * 3.6$$

The volume flow of the medium can be equated with the gas volume to be discharged or filled.

If several aerating or deaerating valves are used, each valve must be configured for the maximum flow velocity. With the calculated volume flow, the correct valve dimension can be determined from the air volume diagram. The velocity in this diagram corresponds to the discharge velocity of the gases at the valve. It is recommended that, if possible, 20m/s is not exceeded to prevent excessive wear on the valve.

Air volume diagram

For smooth operation and a long service life, bleeders should not be overdimensioned. If the flow rate is too high for the predetermined nominal diameter of the connector, the problem can be remedied by increasing the working pressure range with correspondingly lower flow rate.

For more information, please see the Georg Fischer Planning Fundamentals, which serves as a detailed reference work in selecting a valve, or consult our website.

Air volume diagram

--- A speed of more than 20 m/s is not recommended. We suggest about 10 to 15 m/s as optimal speed range.

Electromagnetic flow sensor meter

The conveyance and conversion of raw water to potable water is expensive and demanding. Therefore, investments in modern, reliable and completely selfsufficient control systems are decisive for economic viability. The medium being measured flows through the generated magnetic field. The induced tension is measured by the electrode arrangement, which is proportional to the flow speed of the medium passing through the system.

Valve Finder

GF Valve Finder is a new online tool which helps you and your customers to find the right valve in a quick and convenient way. GF Valve Finder offers three selection criteria: type of valve, type of actuation and/or type of material. The tool guides the customer through the selection process. Option where GF Piping Systems has no offerings in the standard portfolio (e.g. electric actuated diaphragm valves) will be greyed out. By selecting at least one of the options GF Valve Finder will guide our customers directly to a page with matching valves. On this page customers can use the extended search (see left side of result page) and narrow down the results even more.

Have a look on our website and give it a try!

Polyethylene piping systems for
underground fire protection

FM APPROVED

Factory mutual (FM) approved piping systems – used for water supply in fire protection systems

The Factory Mutual Research Corporation (FMRC) is the testing laboratory that is internationally recognized for its work testing components for fire protection systems. Components for fire protection systems are tested to ensure that the products can pass an aggressive level of performance, safety and quality standards. Any GF product that is labelled with the Factory Mutual <FM> symbol indicates that the product has met and even exceeded the rigorous requirements for fire protection systems. The manufacturing processes and the in-house testing facilities at GF have been inspected and approved by FMRC, and are audited frequently to ensure compliance and to promote continuing improvement.

+ Benefits & features

FM – Factory mutual

... is the world's biggest industrial property insurance and risk management organisation.

FM – Approval

... assures your customer's optimal risk management and protection from property loss.

FM – Critical elements

... piping system used for water supply in fire protection systems. Moving the water from its source to its final point of use is often considered the most critical component of the underground system.

FM – Performance

... fire prevention systems must be extremely reliable and capable of safely withstanding both internal and external stresses over long periods of time. More rigorous testing and auditing by FM Approvals personnel ensure enhanced reliability, confidence and quality.

Many companies with international operations build on and insure their properties according to the FM-standards.

Essential parts are the selection, construction and installation of the buried fire-extinguishing pipe system. The material of choice is PE100, which is used for underground FM approved pipes and fittings from GF.
